## 1.2 Description

ESP32-S3-WROOM-1 and ESP32-S3-WROOM-1U are two powerful, generic Wi-Fi + Bluetooth LE MCU modules that are built around the ESP32-S3 series of SoCs. On top of a rich set of peripherals, the acceleration for neural network computing and signal processing workloads provided by the SoC make the modules an ideal choice for a wide variety of application scenarios related to AI and Artificial Intelligence of Things (AIoT), such as wake word detection, speech commands recognition, face detection and recognition, smart home, smart appliances, smart control panel, smart speaker, etc.

ESP32-S3-WROOM-1 comes with a PCB antenna. ESP32-S3-WROOM-1U comes with an external antenna connector. A wide selection of module variants are available for customers as shown in Table 1 and 2. Among the module variants, those embed ESP32-S3R8 operate at  $-40 \sim 65^{\circ}\text{C}$  ambient temperature, ESP32-S3-WROOM-1-H4 and ESP32-S3-WROOM-1U-H4 operate at  $-40 \sim 105^{\circ}\text{C}$  ambient temperature, and other module variants operate at  $-40 \sim 85^{\circ}\text{C}$  ambient temperature. Please note that for R8 series modules (8-line PSRAM embedded), if the PSRAM ECC function is enabled, the maximum ambient temperature can be improved to  $85^{\circ}\text{C}$ , while the usable size of PSRAM will be reduced by 1/16.

### 3.3 Strapping Pins

#### Note:

The content below is excerpted from Section Strapping Pins in [ESP32-S3 Series Datasheet](#). For the strapping pin mapping between the chip and modules, please refer to Chapter 5 [Module Schematics](#).

ESP32-S3 has four strapping pins:

- GPIO0
- GPIO45
- GPIO46
- GPIO3

Software can read the values of corresponding bits from register “GPIO\_STRAPPING”.

During the chip’s system reset (power-on-reset, RTC watchdog reset, brownout reset, analog super watchdog reset, and crystal clock glitch detection reset), the latches of the strapping pins sample the voltage level as strapping bits of “0” or “1”, and hold these bits until the chip is powered down or shut down.

GPIO0, GPIO45 and GPIO46 are connected to the chip’s internal weak pull-up/pull-down during the chip reset. Consequently, if they are unconnected or the connected external circuit is high-impedance, the internal weak pull-up/pull-down will determine the default input level of these strapping pins.

GPIO3 is floating by default. Its strapping value can be configured to determine the source of the JTAG signal inside the CPU, as shown in Table 5. In this case, the strapping value is controlled by the external circuit that cannot be in a high impedance state. Table 4 shows more configuration combinations of EFUSE\_DIS\_USB\_JTAG, EFUSE\_DIS\_PAD\_JTAG, and EFUSE\_STRAP\_JTAG\_SEL that determine the JTAG signal source.

Table 4: JTAG Signal Source Selection

EFUSE_STRAP_JTAG_SEL	EFUSE_DIS_USB_JTAG	EFUSE_DIS_PAD_JTAG	JTAG Signal Source
1	0	0	Refer to Table 5
0	0	0	USB Serial/JTAG controller
don't care	0	1	USB Serial/JTAG controller
don't care	1	0	On-chip JTAG pins
don't care	1	1	N/A

To change the strapping bit values, users can apply the external pull-down/pull-up resistances, or use the host MCU's GPIOs to control the voltage level of these pins when powering on ESP32-S3.

After reset, the strapping pins work as normal-function pins.

Refer to Table 5 for a detailed configuration of the strapping pins.

Table 5: Strapping Pins

VDD_SPI Voltage			
Pin	Default	3.3 V	1.8 V
GPIO45	Pull-down	0	1
Bootling Mode <sup>1</sup>			
Pin	Default	SPI Boot	Download Boot
GPIO0	Pull-up	1	0
GPIO46	Pull-down	Don't care	0
Enabling/Disabling ROM Messages Print During Bootling <sup>2</sup>			
Pin	Default	Enabled	Disabled
GPIO46	Pull-down	See the 2nd note	See the 2nd note
JTAG Signal Selection			
Pin	Default	EFUSE_DIS_USB_JTAG = 0, EFUSE_DIS_PAD_JTAG = 0, EFUSE_STRAP_JTAG_SEL=1	
GPIO3	N/A	0: JTAG signal from on-chip JTAG pins 1: JTAG signal from USB Serial/JTAG controller	

**Note:**

1. The strapping combination of GPIO46 = 1 and GPIO0 = 0 is invalid and will trigger unexpected behavior.
2. By default, the ROM boot messages are printed over UART0 (U0TXD pin) and USB Serial/JTAG controller together. The ROM code printing can be disabled through configuration register and eFuse. For detailed information, please refer to Chapter [Chip Boot Control](#) in *ESP32-S3 Technical Reference Manual*.

VDD\_SPI voltage is determined either by the strapping value of GPIO45 or by EFUSE\_VDD\_SPI\_TIEH. When EFUSE\_VDD\_SPI\_FORCE is 0, VDD\_SPI voltage is determined by the strapping value of GPIO45; when EFUSE\_VDD\_SPI\_FORCE is 1, VDD\_SPI voltage is determined by EFUSE\_VDD\_SPI\_TIEH. Please refer to the following table for default configurations:

Table 6: The Default Value for VDD\_SPI Voltage

Chip Variant	EFUSE_VDD_SPI_FORCE	EFUSE_VDD_SPI_TIEH	VDD_SPI Voltage
ESP32-S3	0	0	Determined by GPIO45
ESP32-S3R2	1	1	Force to 3.3 V

ESP32-S3FN8	1	1	Force to 3.3 V
ESP32-S3FH4R2	1	1	Force to 3.3 V

<sup>1</sup> The current consumption measurements are taken with a 3.3 V supply at 25 °C of ambient temperature at the RF port. All transmitters' measurements are based on a 100% duty cycle.

<sup>2</sup> The current consumption figures for in RX mode are for cases when the peripherals are disabled and the CPU idle.

Note that the data in Table 12 only applies to the module variants that embed the chip variant ESP32-S3.

Table 12: Current Consumption Depending on Work Modes

Work mode	Description	Typ <sup>2</sup>	Unit
Light-sleep	—	— <sup>1</sup>	$\mu A$
Deep-sleep	RTC memory and RTC peripherals are powered on.	8	$\mu A$
	RTC memory is powered on. RTC peripherals are powered off.	7	$\mu A$
Power off	CHIP_PU is set to low level. The chip is powered off.	1	$\mu A$

<sup>1</sup> Please refer to the current consumption of the chip, and add corresponding PSRAM consumption values, e.g., 140  $\mu A$  for 8 MB 8-line PSRAM (3.3 V), 200  $\mu A$  for 8 MB 8-line PSRAM (1.8 V) and 40  $\mu A$  for 2 MB 4-line PSRAM (3.3 V).

<sup>2</sup> Please refer to [ESP32-S3 Series Datasheet](#) if there are any inconsistencies.

Wi-Fi wireless standard		IEEE 802.11b/g/n
Data rate	20 MHz	11b: 1, 2, 5.5 and 11 Mbps 11g: 6, 9, 12, 18, 24, 36, 48, 54 Mbps 11n: MCS0-7, 72.2 Mbps (Max)
	40 MHz	11n: MCS0-7, 150 Mbps (Max)

### Figure 5: ESP32-S3-WROOM-1 Schematics

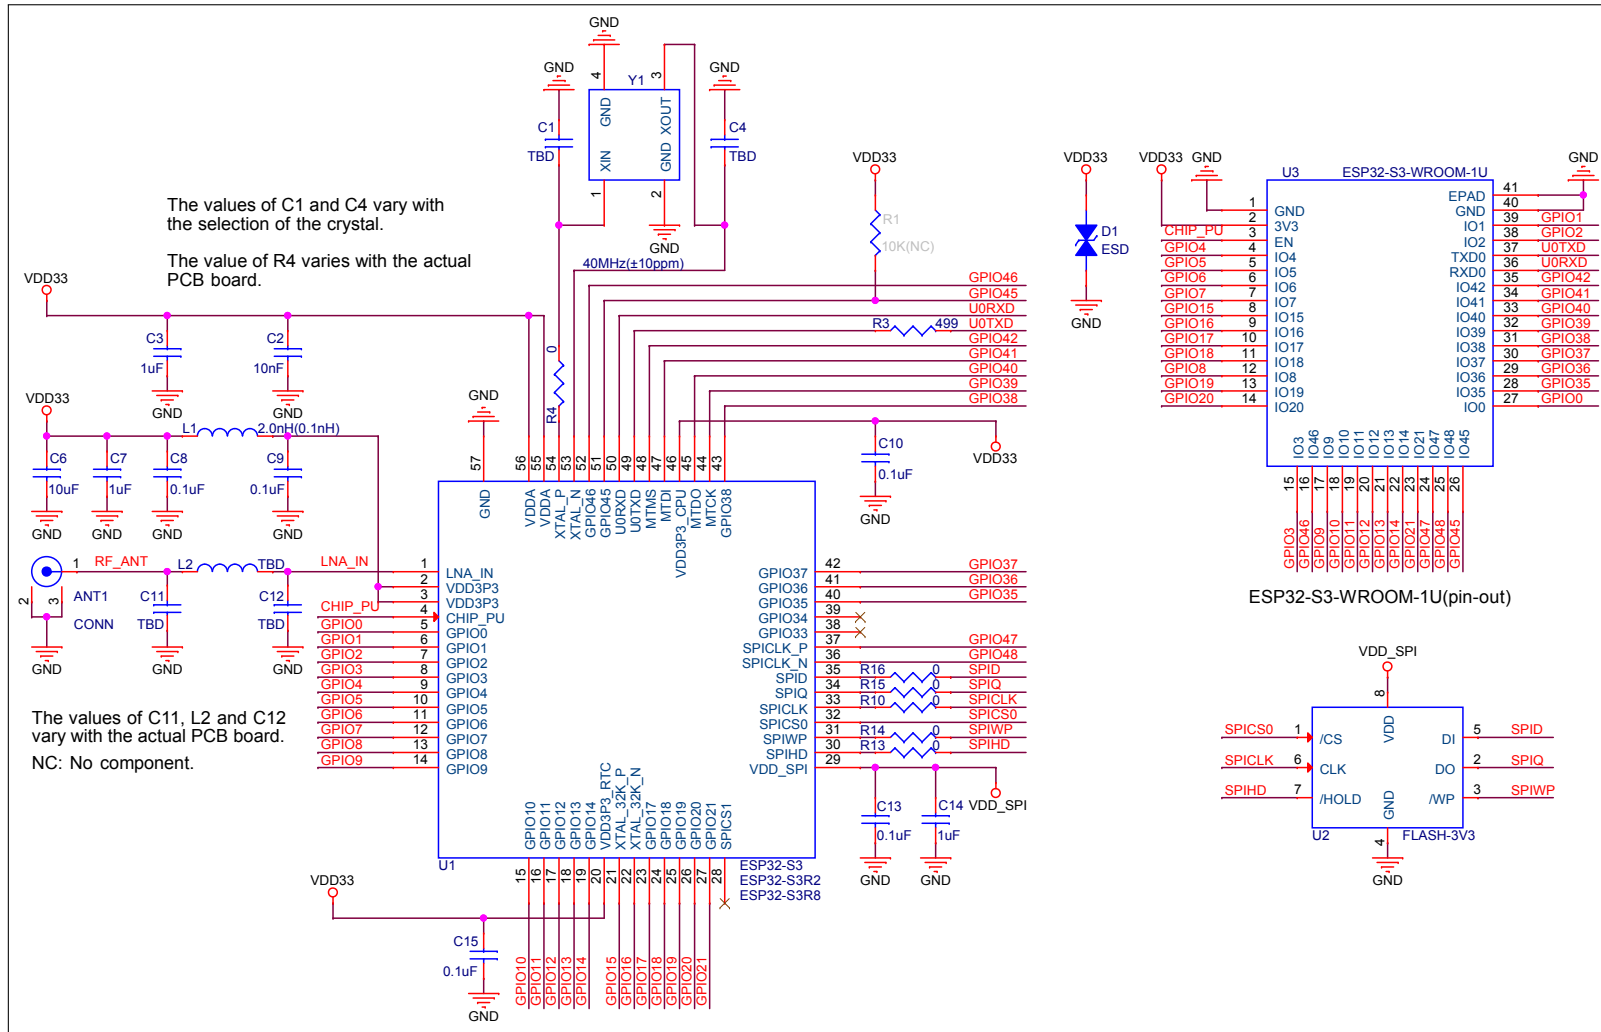

Figure 6: ESP32-S3-WROOM-1U Schematics

Internal pull-up resistor (R1) for IO45 is not populated in the module, as the flash in the module works at 3.3 V by default (output by VDD\_SPI). Please make sure IO45 is not pulled high when the module is powered up by external circuit.

## 6 Peripheral Schematics

This is the typical application circuit of the module connected with peripheral components (for example, power supply, antenna, reset button, JTAG interface, and UART interface).

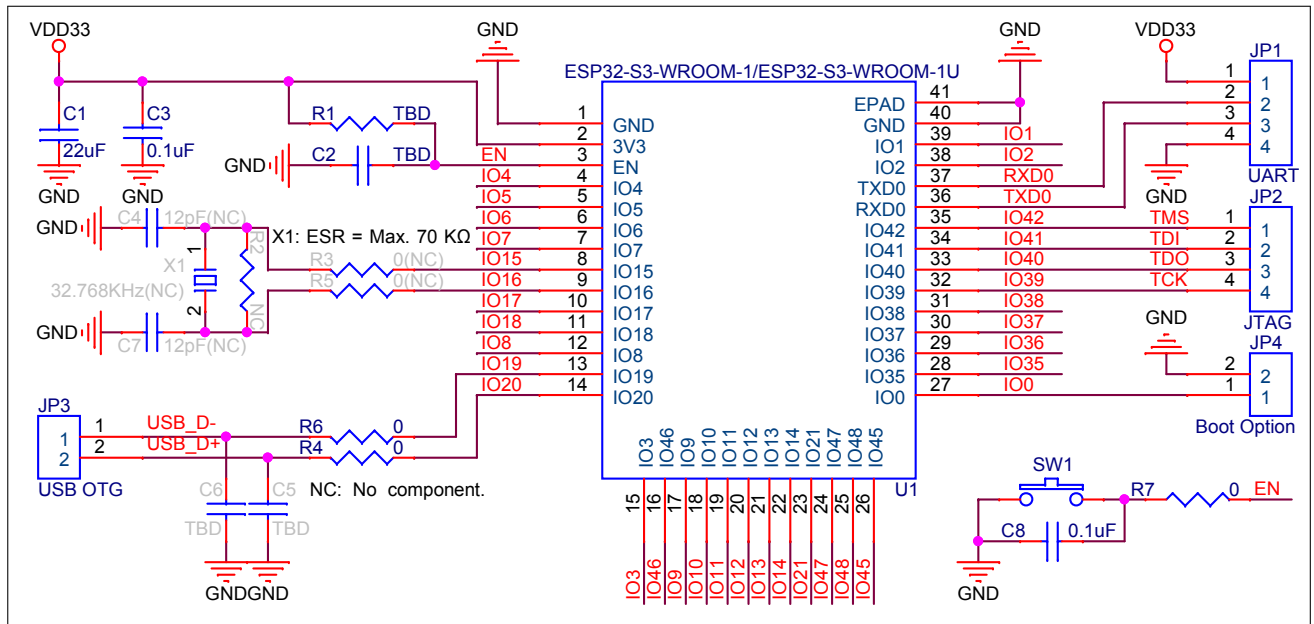

Figure 7: Peripheral Schematics

- Soldering the EPAD to the ground of the base board is not a must, however, it can optimize thermal performance. If you choose to solder it, please apply the correct amount of soldering paste.
- To ensure that the power supply to the ESP32-S3 chip is stable during power-up, it is advised to add an RC delay circuit at the EN pin. The recommended setting for the RC delay circuit is usually  $R = 10\text{ k}\Omega$  and  $C = 1\text{ }\mu\text{F}$ . However, specific parameters should be adjusted based on the power-up timing of the module and the power-up and reset sequence timing of the chip. For ESP32-S3's power-up and reset sequence timing diagram, please refer to Section *Power Scheme* in [ESP32-S3 Series Datasheet](#).

### 7.3 Dimensions of External Antenna Connector

ESP32-S3-WROOM-1U uses the first generation external antenna connector as shown in Figure 12. This connector is compatible with the following connectors:

- U.FL Series connector from Hirose
- MHF I connector from I-PEX
- AMC connector from Amphenol

Figure 12: Dimensions of External Antenna Connector

## 8 Product Handling

### 8.1 Storage Conditions

The products sealed in moisture barrier bags (MBB) should be stored in a non-condensing atmospheric environment of  $< 40\text{ }^{\circ}\text{C}$  and  $/90\%\text{RH}$ . The module is rated at the moisture sensitivity level (MSL) of 3.

After unpacking, the module must be soldered within 168 hours with the factory conditions  $25\pm 5\text{ }^{\circ}\text{C}$  and  $/60\%\text{RH}$ . If the above conditions are not met, the module needs to be baked.

### 8.2 Electrostatic Discharge (ESD)

- Human body model (HBM):  $\pm 2000\text{ V}$
- Charged-device model (CDM):  $\pm 500\text{ V}$

### 8.3 Reflow Profile

Solder the module in a single reflow.

Figure 13: Reflow Profile

## 8.4 Ultrasonic Vibration

Avoid exposing Espressif modules to vibration from ultrasonic equipment, such as ultrasonic welders or ultrasonic cleaners. This vibration may induce resonance in the in-module crystal and lead to its malfunction or even failure. As a consequence, **the module may stop working or its performance may deteriorate.**
